## Summary

We enjoyed a very successful week in the Abruzzo National Park, with sightings of three different Marsican Brown Bears, a very large male tailing a female on Monte Marsicano in rather poor evening light, and then a female or young male walking across a slope of Monte Mattone in much better light the following morning. These were seen from the Camosciara parking area; the Park rangers had to close the trail up Monte Marsicano because of disturbance to these iconic animals. We also had good, though again quite distant, views of Wolves on two mornings at Gioia Vecchio, two sitting in the sun and, on our last morning, one walking across the valley. Added to this, we saw Abruzzi Chamois, Golden Eagles, Griffon Vultures, many Red-backed Shrikes and enjoyed the House Martins constructing their nest just over one of the rooms at the hotel. The wild flowers were at their best, with a host of orchids and carpets of other species. The wet spring and cool wind meant there were fewer butterflies than in some years, but we still saw a good range of insects. The weather was mainly sunny, with the only significant rain when we needed a quiet evening anyway! With excellent hospitality at Hotel Valle dell' Oro and great company, everything contributed to wonderful trip. My thanks to all the group for your enthusiasm and spotting skills.

## Day 1

Thursday 22nd May

### Fly Rome – transfer Pescasseroli

The group members met up with Jessica at Gatwick South Terminal for our 9.40am flight to Rome, where we landed at about 1.15pm. There was time for coffee and lunch while Jessica sorted the minibus, and we set off around 3.00pm, negotiating the Rome ringroad with its usual heavy traffic, and noting flowering Oleanders and Hooded Crows. Once we were on the A24 heading east, the traffic eased, and we enjoyed the small hill-top towns and the increasing woodland, as well as Common Buzzards and Black Kites. We took a break at the Monte Velino services, where Blackcap was heard and where there were plenty of Italian Sparrows. Once past Avezzano and the plain which is the remains of Lake Fucino, we started to climb up into the Abruzzo National Park, noting how Downy Oak (*Quercus pubescens*) gave way to Beech (*Fagus sylvatica*) with brightly flowering Laburnum (*Laburnum anagyroides*). A Red Deer stag was glimpsed in a clearing. We stopped briefly at Gioia Vecchio, seeing a Red Fox with a very fine tail, and had a couple of distant Red Deer stags browsing. A smart Common Redstart was photographed.

We dropped down to the small town of Pescasseroli and found our hotel, the Valle dell' Oro, on the road out towards the ski station. We received a warm welcome from Julia, the manager, and had time to settle in before meeting for dinner at 8.00pm, when Jessica outlined plans for the following day. After a tasty meal, we were very ready for our beds.

## Day 2

Friday 23rd May

### Round hotel – Camosciara

We woke to a morning that was becoming brighter after heavy overnight rain, and were out at 7.00am to explore the local area, and admire the hills and meadows. A pair of House Martins was in a partially constructed nest under

the eaves, and it was a joy to see the air full of this species, which is increasingly rare in much of the UK. Italian Sparrows and Hooded Crows were abundant, and we also saw Greenfinch, Goldfinch, Common Redstart very briefly and a more obliging pair of Serins. A Fox was in a meadow, and we watched it for some time. We looked at a few plants including St. Lucie's Cherry (*Prunus mahaleb*), Dark Grape Hyacinth (*Muscari neglectum*), Snow-in-Summer (*Cerastium tomentosum*) and a Green-winged Orchid (*Anacamptis morio*).

After a good breakfast and with the picnic makings on board, we then drove down the Sangro Valley to Camosciara, in the heart of the National Park. We parked and scanned the hillsides, seeing plenty of Red Deer, some with fawns, and a couple of very distant Abruzzi Chamois. A flock of Red-billed Choughs was over the ridge. We set off up the road that runs along the valley, edged by Turkey Oak (*Quercus cerris*), Field Maple (*Acer campestre*), Cornelian Cherry (*Cornus mas*) and Wild Pear (*Pyrus communis*), among other species. We found Lady Orchid (*Orchis purpurea*), a form of Early Purple Orchid with pointed petals and sepals (*Orchis mascula* subsp. *speciosa*) and Twayblade (*Neottia ovata*). Birds included Blackcap, Chiffchaff and Song Thrush. Moving on slowly, we added Reflexed Crane's-bill (*Geranium reflexum*), Bird's-nest Orchid (*Neottia nidus-avis*), Sword-leaved Helleborine (*Cephalanthera longifolia*), a plant of White Helleborine (*Cephalanthera damasonium*) and a spike of Fly Orchid (*Ophrys insectifera*), among many other species. There were not many butterflies, but those seen included Green-veined White, Wood White, Painted Lady, Common Blue and a Dingy Skipper. Down by the stream, Lady's-slipper Orchids (*Cypripedium calceolus*) were, sadly, still in bud. An endemic longhorn beetle (*Dorcadion arenarium marsicana*) was seen by some, while others were looking at Herb Paris (*Paris quadrifolia*) and Thore's Buttercup (*Ranunculus thora*) with large, kidney-shaped leaves.

We ate our delicious picnic, which included local cheese and wine, at picnic tables near a small bar. We then took the small path over the stream towards two waterfalls. Duke of Burgundy was photographed here. Under the beech trees we found a tiny Coralroot Orchid (*Corallorrhiza trifida*) and a beautiful endemic Trumpet Gentian *Gentiana dinarica*. At the second waterfall, we noted a clump of Heart-leaved Leopard's-bane (*Doronicum columnae*) and a few Bear's-ears (*Primula auricula*). As we wandered down, a Marsh Tit was calling, and another stream-side diversion gave us the endemic Camosciara Butterwort (*Pinguicula vallis-regiae*), restricted to this one valley, and closer gentians. The sun was now warm, and several Common Wall Lizards, both male and female were basking. We then saw that one of the rocks also held a pair of Western Green Lizards, and we spent time enjoying excellent views. One was infested with ticks.

We returned to the hotel with time to relax, before meeting at 5.30pm to work on our checklists before a 6.00pm dinner. Afterwards, we went out to drive back down the Sangro valley. A sounder of Wild Boar of at least six females and numerous ginger-stripey piglets was in a meadow by Opi, and we were able to have good scope views. We then stopped at the bottom of Val Fondillo to scan the lower slopes of Monte Marsicano again. The cloud was building and there was some drizzly rain, but we saw more Red Deer in the poor light. A Fox trotted across the meadow, passing very close to us. A botanical diversion saw us admiring Toothed Orchids (*Neotinea tridentata*) and the form of Late Spider Orchid known by taxonomic 'splitters' as the endemic *Ophrys dinarica*, but more usually recognised now as a form of Apulian Ophrys (*Ophrys holosericea* subsp. *apulica*), or just a variant of Late Spider Orchid (*O. holosericea*, also known as *O. fuciflora*). We returned in the rapidly fading light, despite Field Crickets and Cuckoo still being heard, ready for an early night. Tawny Owl was heard overnight.

## Day 3

Saturday 24th May

## Aschi – La Difesa – Vallone Pesco di Lordo – Passo del Diavolo

This morning we had a very early start, leaving at 4.30am in the dark (with a Common Redstart already singing) to drive down to Aschi at the bottom of the Valle del Giovenco, an area known to be frequented by an Apennine Wolf pack. The Apennine (or Italian) Wolf is a subspecies of Grey Wolf, genetically and morphologically distinct from other populations. A small, dark shape crossing the road was a hare species (either European or Corsican (aka Italian)), but we later saw two more certain Corsican Hares on the road. We arrived at a viewpoint near the village in cloud and light rain, and scanned the hillsides opposite. Nightingales were in full song, and we saw plenty of Red Deer, mainly hinds; a couple had fawns, and some were very close. However, we did not see any Wolves. As the light improved, the rain stopped, but there was still cloud and mist. We tried driving round to the far side of the hill, but the mist was even thicker there, so we returned, passing a couple of large plants of Silver Sage (*Salvia argentea*) with white flowers. Our third stop was from a very muddy track but again, there were just peacefully browsing deer, although there were fresh paw prints, probably of a Wolf, in the mud. We saw a Roe Deer on the hill and round our feet were many Adriatic Lizard Orchids (*Himantoglossum adriaticum*), as well as Man Orchid (*Orchis anthropophorum*) and Apulian Ophrys (*Ophrys holosericea* subsp. *apulica*). On the road bank were lemon-yellow Sparse-flowered Orchids (*Orchis pauciflora*). We returned for breakfast at 8.30am.

After another good breakfast, we drove the short distance to La Difesa, an area of more ancient Beech forest. It was still cloudy with a chilly wind, so it was not great for insects, although we looked at a couple of Red-and-black Leafhoppers *Cercopis vulnerata*. Hoopoes were calling, and one took off and flew up the track. Under the trees were the remains of Snowdrop (*Galanthis nivalis*) and a Bird-in-a-bush (*Corydalis cava*), as well as flowering Bastard Agrimony (*Artemisia agrimonoides*), Woodruff (*Galium odoratum*) and more Herb Paris, Reflexed Crane's-bill and Round-leaved Saxifrage. We enjoyed the ancient trees covered in mosses and lichens, including Lungwort (*Lobaria pulmonaria*). Blackcaps were abundant and Wood Warblers were singing and showed well. Large water troughs were reminders of the many sheep which used to be grazed here and walked down to Puglia for the winter months. Common Toad tadpoles were in the stream. There were plenty of the endemic pansy *Viola eugeniae* in a variety of shades of purple and yellow, the pretty speedwell *Veronica orsiniana* and flowering Solenanthus (*Solenanthus apenninus*), with small, brown-red flowers.

The path continued into the more open Vallone Pesco di Lordo, where a stony patch was bright with the yellow Perennial Wallflower *Erysimum pseudorhaeticum* and Golden Alyssum (*Alyssum diffusum*). Red-backed Shrikes were seen well. Our target species here was the beautiful endemic Marsican Iris (*Iris marsica*), with large purple flowers, which was duly enjoyed, as well as the magenta Ashy Crane's-bill-type *Geranium austroapenninum*. Common Buzzards were overhead and, as we walked back down, we heard a Wryneck calling. We had our picnic back at the hotel, a Black Redstart on the garden fence. Some sat outside in the hotel garden as the sun came out.

Replete, we drove north to the Passo del Diavolo, halfway to Gioia Vecchio. Again, there were many Red-backed Shrikes; some of the males were in song. Common Kestrels were hunting and Woodlarks sang. The sun was now warm, although the cold wind was brisk, and we saw Southern Grizzled Skipper and Small Heath butterflies, and colonies of Franconian Lackey caterpillars. The flowers were beautiful, with a range of colours of Nice Milkwort (*Polygala niceaensis*), blue, magenta and white, yellow Horseshoe Vetch (*Hippocrepis comosa*), White Rock-rose (*Helianthemum apenninum*), plenty of Toothed Orchids (*N. tridentata*) and Burnt Orchids (*Neotinea ustulata*). A large

orchid was a hybrid Lady x Military (*O. x intermedia*) and down the slope we could see 'pure' Military Orchid (*Orchis militaris*). We had good views of two Brown Hares.

Some opted to be dropped off in town as we returned. After a break, we met at 6.30pm to do the checklists, before another tasty dinner and an early night, after a long but excellent day.

## Day 4

Sunday 25th May

### Il Templo – Alba Fucens – near Petrella Liri

This morning, we met for breakfast at 7.30am, and were ready to leave at 8.30pm. We paused briefly in town to pick up picnic food and still-warm bread, before driving north up Valle Chiara. We took the road towards Aschi, stopping at the meadow we call 'the Bisegna Viewpoint', properly named Il Templo. A Fox was in the meadow and a Skylark was singing. A bank bore Early Purple Orchids (*Orchis mascula* subsp. *speciosa*) and a single lemon-yellow Sparse-flowered Orchid (*O. pauciflora*), but also several spikes of the hybrid between them (*Orchis x colemani*) with shades of salmon-pink flowers. A Turtle Dove got up off the road near Pescina, where we noted plenty of Golden Drops (*Onosma echioioides*) on a sunny cliff. We then drove to the north of the plain towards Avezzano, turning up to the Roman site of Alba Fucens. A large bird only glimpsed was probably a Griffon Vulture.

The sun was warm, and there were plenty of insects about. Among the butterflies were good numbers of both Marsh and Spotted Fritillaries, along with Black-veined White, Berger's Clouded Yellow, Southern Grizzled Skipper, and Common and Scarce Swallowtails. There were also many Owly Sulphurs (Owlflies) on the wing. Adriatic Lizard Orchids were flowering profusely, and we also found Bertoloni's Bee Orchids (*O. bertoloni*), Early Spider Orchids (*Ophrys sphegodes*), Dark Ophrys (*Ophrys sphegodes* subsp. *atrata*), Apulian Orchid (*O. holosericea* subsp. *apulica*), and Man Orchids (*Orchis anthropophora*). Common Whitethroat was calling, and we had good views of Eastern Subalpine Warbler. Italian Wall Lizards were enjoying the sun. We explored the magnificent amphitheatre and its surroundings and enjoyed a sunny picnic, before there was a little time to explore the main part of the excavated town.

Leaving this fascinating site, we then drove for about forty minutes past Avezzano and through Capistrello, to reach a site where Griffon Vultures were nesting. Introduced into the Sirente-Velino Natural Park to the north in 1994, the birds have spread and colonised these cliffs independently. We were able to see in the region of ten birds, some on ledges and others in flight, as well as Peregrine Falcon, Raven and Kestrel; Crag Martin was also glimpsed. After a stop for ice creams, we drove across the middle of the Fucino plain, before climbing back up to Gioia Vecchio. The evening light was beautiful, but not good for seeing animals on the slopes. We could see a relatively close Red Deer hind with a fawn, plenty more Red Deer, and a couple of Foxes. We returned to the hotel at 7.30pm for dinner at 8.00pm.

## Day 5

Monday 26th May

### Gioia Vecchio – Val Fondillo – Camosciara

It was another fine morning, and we gathered at 6.00am to drive up to Gioia Vecchio. The Red Deer hind and fawn were still in the valley, and several stags with very fine antlers were browsing or lying in the sun: we could see

the velvet on some of them. The Fox was refound and a solitary Wild Boar was seen briefly, as well as a Roe Deer. Common Redstarts and Serins were singing from television aerials in the old village. However, the highlight came at about 8.00am, when we saw two Wolves sitting in a clearing on the lower slopes of the hillside opposite, enjoying the morning sun! We all had excellent scoped views before one and then the other walked slowly into the trees. Wonderful! Delighted, we returned for breakfast.

We were ready to leave again at 9.30am, and returned to Val Fondillo, this time to walk up the valley. However, as we started, we spent time scanning the slopes of Monte Marsicano, seeing a Golden Eagle being mobbed by a pair of Ravens, and a distant flock of Choughs, as well as Red Deer on the slopes. Closer to hand, we watched Red-backed Shrikes and Long-tailed Tits, among other birds. Some Adonis Blues were flying, as well as Common Blues and Large Whites. A marshy area with a spring held Early Marsh Orchids (*Dactylorhiza incarnata*), Watercress (*Nasturtium officinale*), Water Speedwell and Brooklime (*Veronica anagallis-aquatica* and *V. beccabunga*). A rocky cave held the endemic Reddish Saxifrage (*Saxifraga porophylla*), Rustyback (*Asplenium ceterach*) and the alpine catchfly *Heliospermum pusillum*, while beyond was a Military Orchid (*Orchis militaris*). We crossed the stream and continued through the flowery meadows, seeing Pearl-bordered and Glanville Fritillaries. We had our picnic enjoying the beautiful surroundings, accompanied by a Common Wall Lizard. A Wryneck was seen in flight. We wandered slowly back, seeing a scat full of hair: it was from a Wolf.

After a break, we updated our lists before a 6.00pm dinner, after which we headed out to catch the last of the light. We opted to return down the valley to scan Monte Marsicano, this time from the Camosciara car park. As we pulled in, a Fox was trotting across. To our delight we soon picked up two dark shapes on the rocky slopes which turned out to be two Marsican Brown Bears, a much larger male following a smaller female! Although the light was fading, we were able to watch them for a long time as they crossed the hillside, never too close to each other, but never far apart. At this time of year, males can shadow female bears for several days. We left them on the mountainside, delighted after an excellent day.

## Day 6

Tuesday 27th May

### Camosciara – Castel Mancino

We decided to go out at 6.00am again, to return to Camosciara. As the gate was still locked, we parked on the road and walked in. Although they were very distant, we could see Abruzzi Chamois as well as Red Deer; at one point the two species were side-by-side on the horizon, and we could see clearly the difference in shape and colour, and the markings of the endemic chamois, now split and treated as a different species from both the Pyrenean Chamois to the west, and the Alpine Chamois to the north. A Golden Eagle took off and disappeared over the ridge. One client then spotted a different Brown Bear, either a younger male or a female, walking across the slope of Monte Mattone to our right. It was in an extensive area of grass and low vegetation with occasional scrub and trees, so we were able to watch the animal walk steadily across the whole slope, before it vanished down into Beech forest. In good light, we could see the smaller size, brown coat and pale mantle. What a joy! We were very fortunate in this sighting, because shortly afterwards the sun appeared over the slope where we had seen the bear, and visibility in that direction was almost impossible. We walked back to the minibus, noting Woad (*Isatis tinctoria*) and large patches of pink Nodding Catchfly (*Silene pendula*) on the cliff by the road.

After breakfast, we gathered to drive the short distance into town, where the group had time to explore and shop, while Jessica sorted the makings of the picnic. A large Common Toad was by the river and a Coal Tit was in the conifers by the war memorial. We then drove up and parked above the town by the cemetery, taking the path up to Castel Mancino, the ruins we could see from the hotel. Two stayed by the vehicle, reporting Nuthatch and a treecreeper, probably Short-toed, although both species occur here. The rest took the steep path through the Black and Scots Pines (*Pinus nigra* and *P. sylvestris*), getting some lovely views of a Firecrest at eye level. Rock-roses (*Helianthemum nummularium*) were abundant in the open areas. We enjoyed the extensive views down the valley and over the town, but noticed the cloud building from the north. There were fewer butterflies around, but we saw Brimstone, Orange Tip, Wall Brown and a single Common Blue. As we walked down, we added a Transparent Burnet moth. We did a circuit round the cemetery wall to return to the others. Back at the hotel, the rain started, so we ate our picnic inside. But it was only a shower. The afternoon was spent at leisure, with time to relax or walk locally.

We met at 5.00pm with Paolo Iannica, who runs a local conservation and wildlife tourism company, and who usually co-leads this trip. He explained a little about his role and the status of Marsican Brown Bears in the area. A major genetic census was being carried out this summer by collecting hair samples from small bits of barbed wire attached to 'rub trees', signal trees where bears communicate by scratching. The DNA will be analysed: because the numbers are so low (there are only fifty or sixty adult bears in total), it is important to understand as much as possible about this iconic animal. We also spoke about Wolves and Abruzzi Chamois, and especially about the culture of co-existence between humans and animals. Afterwards, we updated our lists and discussed plans for the morrow, before another delicious dinner, while a thunderstorm rolled around and rain poured down.

## Day 7

Wednesday 28th May

### Val di Rose / Passo Godi – Lago di Barrea – Barrea gorge

Today the group split, with the fitter members climbing through the Val di Rose and the others taking shorter walks. The rain had stopped, and it was another fine but misty morning. After a 7.30am breakfast the mountain group made picnics, and we left at 8.30am to drive to Civitella Alfadena, the start of the Val di Rose at 1120m. The path climbed steeply through Beech forest with clearings, until the tree line was reached at about 1750m, with a steep and stony path continuing to the Passo Cavuto at 1942m, the adjacent tops being about 2000m.

There were many Wood Warblers singing in the forest, and Early Purple and Bird's-nest Orchids (*Orchis mascula* subsp. *speciosa* and *Neottia nidus-avis*) were noted. Once we were above the trees, the flowers were wonderful, and we saw carpets of the endemic pansy *Viola eugeniae*, which was mainly purple up here, and patches of vivid blue Spring Gentians (*Gentiana verna*). Other flowers included Alpine Pasqueflower (*Pulsatilla alpina*), the endemic Reddish Saxifrage (*Saxifraga porophylla*), much fresher than in Val Fondillo, Apennine Pennycress (*Nocea stilos*), *Daphne oleoides*, not yet in flower, plenty of the endemic Alpine Forget-me-not *Myosotis graminifolia*, and cushions of Ciliate Rock-jasmine (*Androsace ciliata*). Black Redstart, Water Pipit and Northern Wheatear were seen, but the stars of the show were the Abruzzi Chamois. Nine animals were seen, some very close, and they gave us some great photo opportunities. It was a steep walk down, and we met in the Bar della Lince at about 5.30pm.

The others drove north from Villetta Barrea, the road climbing all the way. We stopped at a bend with plenty of Late Spider Orchids (*Ophrys holosericea*), Greater Milkwort (*Polygala major*), a Perennial Cornflower (*Centaurea*

*triumfettii*) and St. Bernard's Lily (*Anthericum liliago*). Western Bonelli's Warbler was singing, but was not seen. We continued up to the Passo Godi at 1630m, where we walked along a gently ascending track and explored the hillsides. Here, we also found Spring Gentian, Forget-me-not and Daphne, as well as Mountain Milkwort (*Polygala alpestris*), Tuberous Valerian (*Valeriana tuberosa*), the endemic Tenore's Bugle (*Ajuga tenorei*) and two more orchid species: Elder-flowered (*Dactylorhiza sambucina*) in both lemon and magenta, and Pale (*Orchis pallens*), which is also lemon-yellow. Buzzards circled overhead, and we saw Northern Wheatears, Yellowhammers and more Red-backed Shrikes. We watched shepherds and their dogs bringing a flock of sheep, and another of mixed sheep and goats along the valley. Two men returned to the parking area with baskets full of St George's Mushrooms, which apparently grow mainly under the Dwarf Juniper and wild roses. We drove down to the Lago di Barrea and had our picnic at a café on the shore, which was very busy with school parties.

We then moved on to Barrea, at the far end of the lake, parking in the town. We had eye-level Swifts, Great Crested Grebes on the lake, and Carp visible just under the water surface. We took the short but quite steep path to the gorge, where we watched a cave, seeing three Red-billed Choughs fly out. We later saw fourteen birds, both flying and perched on a cliff, giving good scope views. It took a while to realise that a large bird flying down the gorge was a sub-adult Golden Eagle! We also had superb views of an eye-level Kestrel, with smaller birds including a Blue Tit family, and distant Crag Martins. We were joined by a group of five goats, including two very young kids. New plants here included the Pale Sainfoin (*Onobrychis alba*), Dwarf Buckthorn (*Rhamnus pumila*), Wild Cotoneaster (*Cotoneaster integrifolius*) and the Houseleek *Sempervivum riccii*, plus plenty of Burnt Orchids (*Neotinea ustulata*), and we had lovely views of a Scarce Swallowtail. We walked down a new path, passing Black Henbane (*Hyoscyamus niger*). We returned to Civitella to meet the walkers, returning for another tasty dinner after a long but very satisfying day.

## Day 8

Thursday 29th May

### Gioia Vecchio – return home

With our flight not until 6.30pm, we had time for a last session at Gioia Vecchio. We met at 6.00am to drive up the valley, with some low cloud initially. From the viewpoint, we had good views of a Wild Boar on the slope opposite. A Wolf had been seen earlier, and we were delighted when it reappeared, walking through the scrub and being glimpsed on several occasions before it disappeared. We also had good views of a Roe Deer buck and Red Deer stags in the morning light. We returned for breakfast at 8.30am.

We had to be out of the rooms by 10.30am but there was time for a final walk, or shopping and sitting in the sun before we left at 12.15pm. We took the Bisegna route down onto the plain, picked up the motorway, and said farewell to the beautiful scenery of the Park. We stopped for some very tasty panini en route and made good time, reaching the airport at 3.45pm. Our flight was slightly delayed, but all went smoothly, and we said our goodbyes at Heathrow after a most enjoyable week in the Abruzzo National Park.
